## IBM z/OS Connect EE V3.0

# zCEE Basic Configuration

IBM Z
Wildfire Team –
Washington System Center

Lab Version Date: February 2, 2020

## **Table of Contents**

General Exercise Information and Guidelines	3
Setup and Service Definitions	
Run the jobs to setup RACF framework for server runtime	4
Create a z/OS Connect EE 3.0 server	
Customize the JCL start procedures and start the server	
Deploying Services and APIs	29
Update the z/OS Connect EE Server Configuration	
Deploy the Services	31
Using Postman	31
Using cURL	
Using Postman	
· ·	
Using cURL Deploy and Test the API	45
Optional	49

**Important:** On the desktop there is a file named *Basic Configuration CopyPaste.txt*. This file contains commands and other text used in this workshop. Locate that file and open it. Use the copy-and-paste function (**Ctrl-C** and **Ctrl-V**) to enter commands or text. It will save time and help avoid typo errors. As a reminder text that appears in this file will be highlighted in yellow.

# General Exercise Information and Guidelines

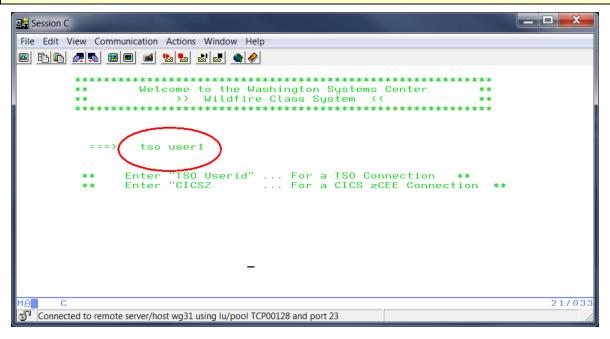

- ✓ This exercise requires using z/OS user identity *USER1*. The password for this user will be provided by the lab instructor.
- ✓ Any time you have any questions about the use of IBM z/OS Explorer, 3270 screens, features or tools do not hesitate to ask the instructor for assistance.
- ✓ Text in **bold** and highlighted in **yellow** in this document should be available for copying and pasting in a file named *Basic Configuration CopyPaste* file on the desktop.
- ✓ Please note that there may be minor differences between the screen shots in this exercise versus what you see when performing this exercise. These differences should not impact the completion of this exercise.

# Setup and Service Definitions

# Run the jobs to setup RACF framework for server runtime

\_\_\_\_\_ 1. Open the *WG31* icon on the workstation desktop. This will start a 3270-terminal session to your z/OS system.

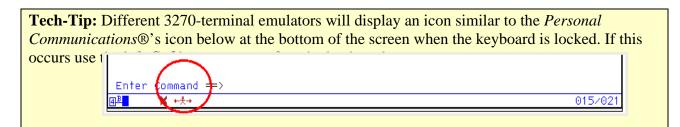

**Tech-Tip:** Desktop tools can be opened either by double clicking the icon or by selecting the icon and right mouse button clicking and then selecting the *Open* option.

- N.B., The 3270-terminal sessions and OMVS screen shots in the remainder of this exercise are shown in reverse video simply for printing purposes
- 2. Enter *TSO USER1* (see below) and presss the 3270 Enter key (the right-Ctrl key sequence): The 3270-emulator used for this workshop (IBM Personal Communication) maps the 3270 enter key to the right Ctrl key (see below). Any references to the *Enter* key in non-3270 windows, OMVS terminal session, etc. refers to the key labeled *Enter* on the keyboard.

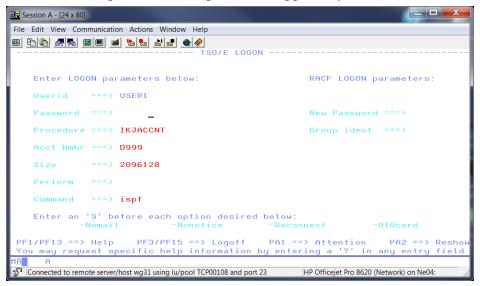

The instructions in this exercise will reference keyboard keys using a **bold** font. In the beginning explicit instructions regarding pressing keyboard keys will be provided. Eventually these explicit instructions to press the *Enter* key for example will not be included. If you are told to enter command then assume the appropriate *Enter* key should be pressed to have the command invoked or executed. Information which must be entered on a screen or panel will be in *bold italics*. References to text on a screen or panel will be in normal *italics*.

In this emulator the **Pause** key is mapped to the clear function. If your laptop has a **Pause**\_key use it to clear the screen. Newer laptops without a **Pause** key use the key sequence **Fn-P** to clear the screen. If none of these works, try a **Break** key or an **Alt-C** key sequence.

3. On the TSO/E LOGON panel enter the password supplied by the instructors.

**Tech-Tip:** An **ISPF** or **PDF** command at the command prompt (===>) on this screen will automatically start ISPF. The copyright information displayed in Step 6 can be bypassed by entering **ISPF NOLOGO** or **PDF NOLOGO** at the command prompt.

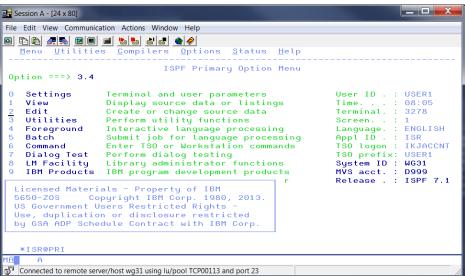

**Tech-Tip:** If for some reason you are disconnected from your TSO session and cannot log in because your TSO session is still active you can enter an *S* beside –*Reconnect* near the bottom of the panel to reconnect to your session.

4. In a TSO session whenever you see the string \*\*\* (three asterisk) appear (as below) as the last line in any terminal output there is more output is waiting to be displayed. Press the Enter key when you are ready to see this additional output. Also remember that notification messages such as jobs completing, etc. will not be displayed unless the Enter key is pressed

```
File Edit View Communication Actions Window Help

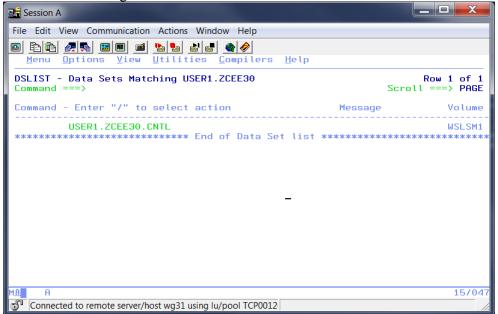

| Comparison | Communication | Actions Window Help
| Comparison | Communication | Actions Window Help
| Comparison | Communication | Actions Window Help
| Comparison | Comparison | Communication | Actions Window Help
| Communication | Actions Window Help
| Communication | Communication | Communication | Actions Window Help
| Communication | Communicat
```

5. You should now be at the main ISPF panel (see below). Press the **Enter** key to dismiss the *Copyright* statement.

6. Enter ISPF command 3.4 in the area after the *Option*===> prompt in the upper left (see above) and press the **Enter** key to display the *Data Set List Utility* panel.

7. On the *Data Set List Utility* panel enter *USER1.ZCEE30* in the area beside *DSNAME level* and press the **Enter** key to display a list of data sets whose names begin with *USER1.ZCEE30*. You should see something like the list below:

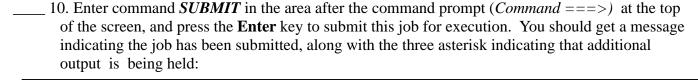

8. Enter *E* (for "edit") next to the data set *USER1.ZCEE30.CNTL*, and press **Enter**. You should see the a list of members in the partitioned data set.

9. Enter **B** (for "browse") next to member **ZCEERCF1** and press **Enter**: You should see a job with several RACF commands (see below):

```
ADDGROUP LIBGRP OMVS(AUTOGID) OWNER(SYS1)
ADDUSER LIBANGE DFLTGRP(LIBGRP) OMVS(AUTOUID HOME(/u/libange/) -
  PROGRAM(/bin/sh)) NAME('LIBERTY ANGEL') NOPASSWORD NOOIDCARD
ADDUSER LIBSERV DFLTGRP(LIBGRP) OMVS(AUTOUID HOME(/u/libserv/) -
  PROGRAM(/bin/sh)) NAME('LIBERTY SERVER')
ALTUSER LIBSERV PASSWORD(LIBSERV) NOEXPIRED
RDEFINE STARTED BAOSTRT.* UACC(NONE)
  STDATA(USER(LIBSERV) GROUP(LIBGRP) -
  PRIVILEGED(NO) TRUSTED(NO) TRACE(YES))
RDEFINE STARTED BBGZANGL.* UACC(NONE) -
  STDATA(USER(LIBANGE) GROUP(LIBGRP) -
  PRIVILEGED(NO) TRUSTED(NO) TRACE(YES))
SETROPTS RACLIST(STARTED) REFRESH
RDEFINE SURROGAT BPX.SRV.LIBSERV
RDEFINE SURROGAT LIBSERV.SUBMIT
PERMIT BPX.SRV.LIBSERV CLASS(SURROGAT) ID(ZCEEADM) ACC(READ)
PERMIT LIBSERV.SUBMIT CLASS(SURROGAT) ID(ZCEEADM) ACC(READ)
SETROPTS RACLIST(SURROGAT) REFRESH
```

**Tech-Tip:** This job creates a RACF group and IDs for the Angel process and z/OS Connect EE V3.0 servers, and then it creates the two STARTED task profiles with these IDs assigned to these started tasks. Finally, the RACF resources that allows members of a z/OS Connect administrators group (ZCEEADM) to act as a surrogate of user LIBSERV and/or submit jobs as LIBSERV are defined.

IKJ56250I JOB ZCEERCF1(JOB00060) SUBMITTED  $^{***}$ 

\_\_\_\_\_11. Press the **Enter** to display the additional output. You should then see either a message indicating the job has completed with MAXCC=0000 (which is good) or a redisplay of the ISPF browse panel. If the latter, keep pressing **Enter** until the job completes.

 $08.19.07\ JOB00060\ \$HASP165\ ZCEERCF1\ ENDED\ AT\ WG31\ \ MAXCC=0000\ CN(INTERNAL)\\ ***$ 

12. Press the **F3** key to return to the list of members.

13. Enter *B* next to the **ZCEERCF2** member and press the **Enter** key. This is another set of RACF commands that define the RACF *SERVER* resources which allow the use of various z/OS authorized services. *WP102604 Getting Started Guide* describes these commands in more detail. *Submit* this job for execution (see Step 10 above). Allow this job to complete before continuing.

```

SETROPTS RACLIST(SERVER) REFRESH
```

14. Press **F3** to exit the browse session.

## **Summary**

You just created a set of essential SAF profiles for z/OS Connect EE V3.0 to use. These are detailed in the WP102604 Getting Started Guide. The process was streamlined for this lab by coding them in a job so submitting this job would create what was needed.

## Create a z/OS Connect EE 3.0 server

z/OS Connect EE V3.0 was installed using SMP/E ahead of the workshop and the *zconsetup* command has been invoked to create a symbolic link to the */var/zosconnect/v3r0/extensions* directory. This directory contains property files which provide information required for locating z/OS Connect EE features and executables by Liberty at runtime.

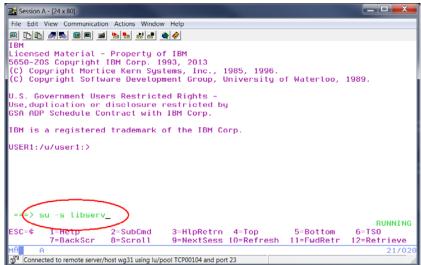

Now it's time to create a z/OS Connect server. This is done by executing a relatively simple shell script (*zosconnect*) provided with z/OS Connect EE. Remember that a z/OS Connect server runs in a Liberty runtime so occasionally there will be references to Liberty.

**Tech-Tip:** The OMVS directories and files created by this script must be owned by the same RACF identity associated with the z/OS Connect started task (e.g. BAQSTRT). This is problematic since this RACF identity is restricted and cannot be used to logon to TSO or submit jobs to create these directories and files.

There are various ways to ensure this ownership is set correctly. One is to create the directories and files invoking the OMVS commands using your regular RACF identity. Then use the Unix System Services (USS) command *chown* (change owner) to change the ownership of the directories and files to the RACF identity of the started task. Another way is to use Telnet clients like PuTTY or TeraTerm to access OMVS using the restricted RACF identity and then invoking OMVS commands with the restricted identity.

This exercise uses a mixture of all these techniques. In a z/OS OMVS shell the USS command *su* (switch user) is used to switch the current OMVS RACF identity to the RACF identity of the started task before invoking any commands or it uses the *chown* command to change ownership when executing commands in a MVS batch job. PuTTY is used start an OMVS shell with the restricted identity to update the z/OS Connect server configuration file with USS *cp* (copy) commands. All of these techniques are mostly interchangeable and are shown to demonstrate the options available.

\_\_1. In the existing 3270-terminal session enter TSO command *OMVS* (e.g. *TSO OMVS*) at the command prompt and press **Enter** to start an ISPF OMVS shell session. You should see the screen below

\_\_\_\_\_2. At the prompt, enter OMVS command su \_s libserv (see above) and press the 3270-terminal session's **Enter** key. Note that libserv is the RACF identity created and associated with the BAQSTRT started task when you ran the **ZCEERCF1** job in the previous section.

**Tech-Tip:** *LIBSERV* is the RACF identity created by the *ADDUSER* command executed when job ZCEERCF1 job was executed in the previous section. The *ALTUSER* command in the same job set the password for *LIBSERV* to *LIBSERV*.

The ability to switch to this RACF identity without requiring a password in the *su* command was granted by defining the *BPX.SRV.LIBSERV* surrogate resource to RACF and then permitting user USER1 read access to this surrogate resource in *ZCEERCF1*.

It is very important that this command or alternatives be considered when creating a z/OS Connect EE (zCEE) server, otherwise the server may not start or perform correctly. The RACF identity of the zCEE started task, e.g. *LIBSERV* and must be either be the owner or explicitly given read/write access to the directories and files in *the /var/zosconnect/server/myServer* directory structure

- N.B. Instructions to press the **Enter** key will be omitted in subsequent steps; pressing **Enter** should be assumed whenever a command, script, etc. is to be executed.
- \_\_\_\_3. When you are logged on, enter the *id* command to confirm the user ID (*uid*) and group ID (*gid*) values are for LIBSERV and LIBGRP.

```
USER1:/u/user1:> su -s libserv
$ id
uid=200019(LIBSERV) gid=200017(LIBGRP)
$
```

\_\_\_\_4. The z/OS Connect *zosconnect* shell script needs to be able to locate the Java executables. Use following command in the OMVS session to *export* the environment variable *JAVA\_HOME*. This environment variable identifies the directory containing the location of the Java binaries.

#### export JAVA\_HOME=/usr/lpp/java/J8.0\_64

\_\_5. Change to the directory containing the z/OS Connection script *zosconnect* using an OMVS *cd* command:

## cd /usr/lpp/IBM/zosconnect/v3r0/bin

**Tech-Tip:** If you every have any questions about which directory your session is current using use the *pwd* (print working directory) to display the current directory path.

\_\_\_\_6. Export environment variable (*WLP\_USER\_DIR*) to identify the directory where z/OS Connect EE V3.0 server configurations will reside.

#### export WLP USER DIR=/var/zosconnect

**Tech-Tip:** The *WLP\_USER\_DIR* will be exported in the startup JCL. The value used in the JCL must be the same as the value used when the server was created.

\_7. Invoke the zosconnect script to create the z/OS Connect server named myServer:

```
./zosconnect create myServer --template=zosconnect:default
```

You should see the following in response.

```
Server myServer created.
```

**Tech-Tip:** Other templates which can be specified with the *zosconnect create* command are *zosconnect:apiRequester*, *zosconnect:sampleCicsIpicCatalogManager*, *zosconnect:sampleWolaCatalogManager*, *zosconnect:sampleImsPhonebook* and *imsmobile:imsdefault*.

**Tech-Tip:** Below is an example of creating a server using these same commands in an MVS batch job. Again, this job runs under the authority of RACF identity LIBSERV by using RACF SURROGAT resources. If a surrogate is not used, then the ownership of the directories and files created by running this job must be changed so they are owned by the user associated with the server's started task.

```
//ZCEESRVR JOB 'ZCEE Create', CLASS=A, REGION=OM, NOTIFY=&SYSUID, USER=LIBSERV
//* Step ZCEESRVR - Use the zocconnect command to create a server
//ZCEEZRVR EXEC PGM=IKJEFT01, REGION=0M
//SYSERR DD SYSOUT=*
//STDOUT DD SYSOUT=*
//STDENV DD *
ZCEEPATH=/usr/lpp/IBM/zosconnect/v3r0
PATH=/usr/lpp/java/J8.0_64/bin:$PATH
JAVA_HOME=/usr/lpp/java/J8.0_64
WLP_USER_DIR=/var/zosconnect
//SYSTSPRT DD SYSOUT=*
//SYSTSIN DD *
BPXBATCH SH $ZCEEPATH/bin/zosconnect create myServer +
--template=zosconnect:default +
 1 > /tmp/zceeStd.out 2> /tmp/zceeStd.err
//*****************
//* Step COPY - Copy the zocconnect commmand output to the job log
//*********************************
//COPY
      EXEC PGM=IKJEFT01, DYNAMNBR=300
//SYSTSPRT DD SYSOUT=*
//ZCEEOUT DD PATH='/tmp/zceeStd.out',PATHDISP=(DELETE,DELETE)
//ZCEEERR DD PATH='/tmp/zceeStd.err',PATHDISP=(DELETE,DELETE)
//STDOUT DD SYSOUT=*,DCB=(LRECL=1000,RECFM=V)
//STDERR DD SYSOUT=*,DCB=(LRECL=1000,RECFM=V)
//SYSPRINT DD SYSOUT=*
//SYSTSIN DD *
OCOPY INDD(ZCEEERR) OUTDD(STDERR)
OCOPY INDD(ZCEEOUT) OUTDD(STDOUT)
```

\_\_\_\_\_8. Enter the following OMVS command to display the contents of the /var/zosconnect/servers subdirectory:

#### ls -al /var/zosconnect/servers

#### You should see:

```
$ ls -al /var/zosconnect/servers
total 96
drwxr-x--T 6 LIBSERV SYS1 8192 Oct 31 11:57 .
drwxrwxrwx 4 BAGWELL SYS1 8192 Oct 29 15:17 ..
drwxr-x--T 3 LIBSERV SYS1 8192 Oct 29 15:17 .classCache
drwxr-x--- 2 LIBSERV SYS1 8192 Oct 31 11:57 .logs
drwxr-x--- 3 LIBSERV SYS1 8192 Oct 31 11:57 myServer
```

The myServer directory was created by zosconnect command in the previous step.

\_\_\_9. Now display the contents of the /var/zosconnect/servers/myServer directory by entering OMVS command:

## ls -al /var/zosconnect/servers/myServer

#### You should see:

```
$ ls -al /var/zosconnect/servers/myServer total 66 drwxr-x--- 3 LIBSERV SYS1 8192 Oct 31 11:57 . drwxr-x--T 6 LIBSERV SYS1 8192 Oct 31 11:57 .. drwxr-x--- 4 LIBSERV SYS1 8192 Aug 1 16:23 resources -rw-r---- 1 LIBSERV SYS1 25 Oct 31 11:57 server.env -rw-r---- 1 LIBSERV SYS1 442 Oct 31 11:57 server.xml drwxr-x--- 3 LIBSERV SYS1 8192 Oct 31 11:57 workarea
```

You just created a server, but right now it's just a skeleton without any service definitions or deployed APIs. Next you will customize the JCL start procedures for the Angel process and the server.

\_\_10. Terminate the OMVS session by entering the *exit* command twice to redisplay an ISPF panel. The first exit terminates the *libserv* session and the second exit terminates the *user1* session.

**Tech-Tip:** Symbolic links have been created from a single directory to each of the server configuration directories on this image in order to simplify administration. Directory /var/zcee was created and the command *ln -s /var/zosconnect/servers/myServer /var/zcee/myServer* was entered at an OMVS prompt to create this symbolic linkage for this server.

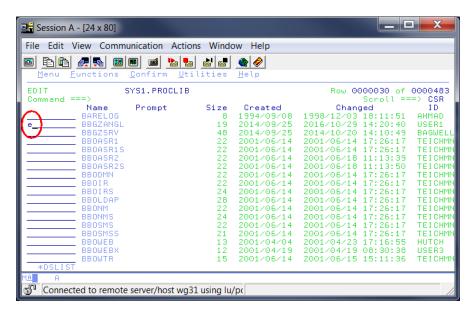

Start an OMVS shell and enter command *ls -al /var/zeee* at the command prompt. You should see something like what is shown below:

```
lrwxrwxrwx
            1 USER1
                                   32 Jan 31 12:43 myServer ->
/var/zosconnect/servers/myServer
                                   36 Sep 10 08:40 wlpoidop ->

lrwxrwxrwx 1 JOHNSON SYS1
                                   36 Jan 15 2019 zceesrv2 ->
/var/ats/zosconnect/servers/zceesrv2
lrwxrwxrwx 1 JOHNSON SYS1
                                   36 Jul 2 2019 zceesrv3 ->
/var/ats/zosconnect/servers/zceesrv3
```

Notice that the use of symbolic links provides a single directory for accessing the different Liberty servers configured on this LPAR. These servers were configured with 4 different values for the WLP\_USER\_DIR environment variable, /var/zosconnect, /var/ats/zosconnect, /var/wlp and /var/cicsts/zosconnect. There is also a symbolic link to a common or shared directory /var/zcee/zc3lab was also created for containing common configuration elements.

## Customize the JCL start procedures and start the server

- \_\_\_\_1. In your 3270-terminal session enter ISPF command =3.4 in the command prompt area and press Enter.
  - \_\_2. Enter SYS1.PROCLIB in the area beside Dsname Level and press Enter.
  - \_3. Type an **E** (edit) next to the *SYS1.PROCLIB* data set and press **Enter**.
  - \_\_4. You will now see a long list of members in the *SYS1.PROCLIB* data set. Enter command *L BBG* after the command prompt (Command ===>) and press **Enter**. Locate the **BBGZANGL** member and place an **E** (edit) next to **BBGZANGL** to open this member in edit mode so changes can be made to the member.

This JCL procedure was copied this member to SYS1.PROCLIB prior to the workshop. This JCL is supplied in the z/OS Connect EE V3.0 SBAQSAMP target data set.

N.B. Instructions to press the **Enter** key should be assumed in subsequent steps as appropriate in order to execute commands, etc.

\_\_\_\_5. Update the BBGZANGL JCL procedure to change the value of the SET ROOT parameter on line 3 to the location of the Liberty code shipped with z/OS Connect, e.g. /usr/lpp/IBM/zosconnect/v3r0/wlp.

## // SET ROOT='/usr/lpp/IBM/zosconnect/v3r0/wlp'

	3 to save the member and exit the edit session.  up (F7) and locate member BAQSTRT. Place and E next to the member in order to open the							
membe	er so changes can be made to the member.							
This is the JCL procedure used to start the z/OS Connect EE V3.0 server. This JCL was copied to <i>SYS1.PROCLIB</i> prior to the workshop as well.								
	e going to make three changes to this JCL procedure The first is to replace the first line so the S= specifies your server's name <sup>1</sup> .							
9. Clear li	ine 1 by placing your cursor at the start of the line (on the first slash in column 1):							
	000001 //BAQSTRT PROC PARMS='defaultServer'							

- \_\_\_10. Then press the **End** key. That should clear the line of all characters.
- \_\_\_11. Copy/Paste the JCL statement below on line 1 by using **Ctrl-C** of the text from the copy/paste file and then selecting  $Edit \rightarrow Paste$  or **Ctrl-V** in the 3270-terminal session.

```
//BAQSTRT PROC PARMS='myServer'
```

The result should be:

```
000001 //BAQSTRT PROC PARMS='myServer'
000002 //*
000003 //* Licensed Materials - Property of IBM
```

**Important:** In the above instructions the  $Edit \rightarrow Paste$  translates to click the Edit tool in the tool bar of the 3270-terminal session and then select the Paste option. The  $\rightarrow$  arrow will be used in later steps for selecting other tools in a tool bar and selecting an option in the 3270-terminal session and other windows.

You could have just overtyped *defaultServer* with *myServer*. We chose to go with copy-and-paste to eliminate any chance of a case mis-match or typo. The field was cleared first because the original text in the line was longer than its replacement.

- \_\_\_\_12. The next two lines to be updated are the // SET ZCONHOME= (line 38) and the JAVA\_HOME= (line 47) environment variables. Do the following:
  - Scroll down (**F8**) until you see the *SET ZCONHOME*= line:
  - Place your cursor at the start of the line (the first slash):
  - From the copy-and-paste file, copy the line:

```
// SET ZCONHOME='/usr/lpp/IBM/zosconnect/v3r0'
```

```
000037 //*
000038 // SET ZCONHOME='/usr/lpp/IBM/zosconnect/v3r0'
000039 //*
```

1 You could start the server with S BAQSTRT,PARMS='myServer' and avoid updating this line in the JCL. We chose to hard-code the server name for this workshop so the start is a simple S BAQSTRT.

Setup and Service Definitions

16 of 49

- Scroll down (**F8**) and locate the *JAVA HOME*= line. It should be line 47:
- Place your cursor at the start of that line and press the **End** key to clear the line.
- From the copy-and-paste file, copy the line:

## JAVA\_HOME=/usr/lpp/java/J8.0\_64

- Place your cursor at the start of that line and press the **End** key to clear the line.
- Locate the WLP USER DIR= line. It should be line 48:
- Place your cursor at the start of that line and press the **End** key to clear the line.
- From the copy-and-paste file, copy the line:

#### WLP USER DIR=/var/zosconnect

• In your 3270-terminal session, select  $Edit \rightarrow Paste$  (you may need to remove a trailing > character). The result should be:

```
000045 //STDENV DD *
000046 _BPX_SHAREAS=YES
000047 JAVA_HOME=/usr/lpp/java/J8.0_64
000048 WLP_USER_DIR=/var/zosconnect
000049 #JVM_OPTIONS=<Optional JVM parameters>
```

Now you're ready to start the *Angel* process and the server.

**Tech-Tip:** An additional DD statement can be added to the JCL which will provide useful information regarding the status of the z/OS Connect. Normally detailed Liberty messages are written to a OMVS file in ASCII but if you add a DD statement for DD name MSGLOG and specify SYSOUT=\* a subset of these messages will be included in the SPOOL of the task.

- 13. Go to SDSF in your 3270-terminal session by entering ISPF command =sdsf.da in the command field and pressing Enter. The da stands for display active and it is the z/OS facility for show running tasks and completed jobs.
  14. Next, enter PRE BBG\* in the command field and press Enter. This sets a "prefix" so only tasks starting with string BBG are shown. The Angel task starts with BBG.. After entering that command, you should see the new prefix is in effect:
- \_\_\_16. Enter the MVS command *S BBGZANGL* after the command prompt.

**Tech-Tip:** MVS and JES2 commands can be entered from SDSF by enter a / (slash) on the command line followed by the command itself (e.g. /D T). The command results can be found in the system log. If a command is especially long then simply enter a / (slash) to display *a SDSF* – *System Command Extension* panel where a command can span multiple lines. When a MVS command must be entered, the instructions in these exercises will indicate that the command is a MVS command and you may enter the command at the prompt by using the / (slash) prefix or using the *SDSF* – *System Command Extension* panel.

\_\_\_17. Keep pressing the **Enter** key until you should then see the Angel process is running.

```
Display Filter View Print Options Search Help

BBGZANGL 0.00 STEP1 FE NS LIBANGE WG31 0
```

- \_\_\_\_19. Change the prefix again by entering *PRE BAQ\** at the command line. The *BBGZANGL* task no longer shows (it's still running, but the prefix no longer matches).
- \_\_\_\_20. Enter the command MVS command *S BAQSTRT* after the command prompt press **Enter** until you see an active BAQSTRT task.

```
Display Filter View Print Options Search Help

SDSF DA WG31 WG31 PAG 2 CPU 8 LINE 1-1 (1)

COMMAND INPUT ===> SCROLL ===> CSR =

NP JOBNAME StepName ProcStep JobID Owner C Pos DP Real Paging SIO

BAQSTRT BAQSTRT ZCON STC00048 LIBSERV IN F8 10T 0.00 21640
```

You should see that *LIBSERV* is the ID that owns the started task. That is a result of the RACF generated by the *ZCEERCF1* job you ran earlier. The STARTED profile matched to the BAQSTRT start procedure and assigned the ID *LIBSERV* to it.).

**Note:** The z/OS Connect EE server is running with *LIBSERV*'s RACF authority. This is why it was important to run the *zoconnect create* command as LIBSERV and why it is important in subsequence steps to use the *LIBSERV* identity when deploying Service ARhive (SAR) files. Also note that in later steps when files are included into the server.xml configuration file, the files that are included are owned by *LIBSERV*. All of this is done to avoid OMVS permission issues.

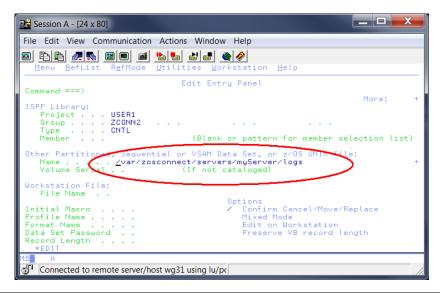

Both the Angel process and the z/OS Connect EE V3.0 server are started. Let's go look at the *messages.log* file for the server.

**Tech-Tip:** MVS and JES2 commands can be entered from SDSF by enter a / (slash) on the command line followed by the command itself (e.g. /D T). The command results can be found in the system log. If a command is especially long, then simply enter a / (slash) to display *a SDSF - System Command Extension* panel where a command can span multiple lines. When a MVS command must be entered, the instructions in these exercises will indicate that the command is a MVS command and you may enter the command at the prompt by using the / (slash) prefix or using the *SDSF - System Command Extension* panel.

\_\_\_20. Go to the ISPF Edit Entry Panel (option 2) by entering ISPF command =2 on the command line and pressing **Enter**.

**Tech-Tip:** Most of the subsequent steps in this section can be performed using the IBM z/OS Explorer. If you are interested in doing these steps using this Eclipse tool contact the instructor.

\_\_\_21. Enter /var/zosconnect/servers/myServer/logs into the area beside Name under Other Partitioned, Sequential or VSAM Data Set, or z/OS UNIX file: and press Enter.

**Tech-Tip:** Try using the symbolic link discussed earlier, e.g. /var/zcee/myServer/logs instead.

\_\_22. This will display the contents of the OMVS directory where the z/OS Connection messages are written to file *messages.log*.

```

000026
            deployed services and APIs is a prudent option for z/OS Connect EE
000027 Polling might be convenient for iterative development and test
000028 systems, but not for production.
000029
000030
            Configuration elements that can drive significant polling activity
000031 default are specified below to explicitly disable automatic polling.
000032 Further element types to consider for polling interval include
000033
         zosconnect_zosConnectDataXform (default 2 seconds) and
000034
         keyStore (default 500 milliseconds).
```

```
000035
000036
         Consider setting the updateTrigger attribute to "polled" if changes
000037
         to associated resources need to be picked up automatically, and tune
         the polling interval accordingly. The attribute that controls polling
000038
000039
         frequency for each of these elements is included, together with its
000040
         associated default value.
000041
000042
000043 <!-- config requires updateTrigger="mbean" for REFRESH command support
000044 <config updateTrigger="mbean" monitorInterval="500"/>
000045
000046
          <!-- zosConnect APIs -->
000047
           <zosconnect_zosConnectAPIs updateTrigger="disabled" pollingRate="5s"</pre>
000048
000049
          <!-- zosConnect Services -->
000050 cosconnect_services updateTrigger="disabled" pollingRate="5s"/>
000051
000052
       <!-- applicationMonitor is not applicable for zCEE servers -->
000053
       <applicationMonitor updateTrigger="disabled" dropinsEnabled="false"/>
000054
000055 </server>
```

That is a *very* minimal server.xml file created from the default template. Other templates will generate server.xml files based on their parameters.

In the next step we will have you copy in a new server.xml file that will add quite a few more XML elements. The dynamic nature of Liberty will incorporate the new configuration without requiring a server restart.

**Tech-Tip:** Note that by default the *updateTrigger* attributes are disabled for APIs and services. These will need to be enabled if auto update is desired.

27. Add the following include after the *server description=new server* line.

<include location=''/wasetc/zc3lab/basic.xml'' optional=''true''/>

\_\_\_\_28. Including this file add a new feature to the server, *appSecurity-2.0* which enables application security and some of the other elements required for basic security.

```
<server description="basic security">
   <!-- Enable features -->
   <featureManager>
       <feature>appSecurity-2.0</feature>
   </featureManager>
   <keyStore id="defaultKeyStore" password="Liberty"/>
   <webAppSecurity allowFailOverToBasicAuth="true" />
   <basicRegistry id="basic1" realm="zosConnect">
        <user name="Fred" password="fredpwd" />
   </basicRegistry>
   <authorization-roles id="zos.connect.access.roles">
       <security-role name="zosConnectAccess">
            <user name="Fred"/>
        </security-role>
    </authorization-roles>
</server>
```

Figure 1: Contents of basic.xml

"Basic" means a user is authentication by providing a user identity and password. In this case the user registry will be provided by the Liberty server itself. For now it's a simple way to satisfy the security requirements of z/OS Connect EE V3.0. In subsequent section of this exercise, SAF (e.g. RACF) will be implemented.

- 29. Use the **F3** key to end the edit session.
- \_\_\_30. Adding this file using an *include* statement refreshing the z/OS Connect EE V3.0 server. Enter the following MVS command to refresh the configuration *FBAQSTRT,ZCON,REFRESH*

Next, we're going to do a preliminary test of your z/OS Connect EE V30 server, even though you do not yet have any services or APIs defined.

**Tech-Tip:** MVS commands can be entered using SDSF. In ISPF, enter the command *=SDSF.LOG* and add the / (slash) prefix to the command, e.g. /F BAQSTRT,ZCON,REFRESH

\_\_31. When the message that the server configuration has been successfully updated appear in the *messages.log* file (see below), open the Firefox browser on your desktop.

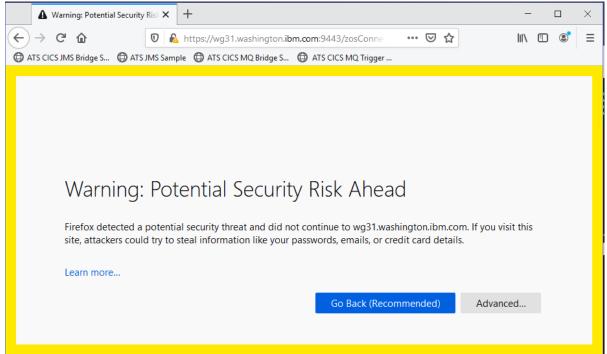

```
CWPKI0803A: SSL certificate created in 5.313 seconds. SSL key file: /var/zosconnect/servers/myServer/resources/security/key.jks CWWKS9112A: The web application security settings have changed. The following properties were modified: allowFailOverToBasicAuth=true CWWKS9120I: Authorization roles with id="zos.connect.access.roles" have been successfully processed CWWKG0017I: The server configuration was successfully updated in 5.481 seconds. CWWKO0219I: TCP Channel defaultHttpEndpoint-ssl has been started and is now listening for requests on host * (IPv4) port 9443.
```

Enter the following as the URL:

## https://wg31.washington.ibm.com:9443/zosConnect/apis

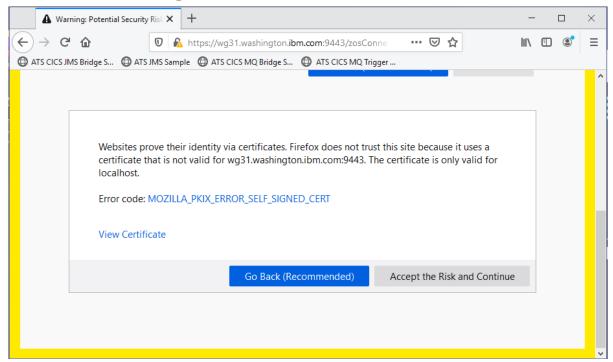

This will query the server for configured APIs. Even thought you will receive a response indicating no APIs are configured this is still a good test of connectivity to the server. But before we see the screen showing no APIs are defined we first must address an issue where the z/OS Connect EE server is using a self-signed certificate that is not recognized by the browser and we must authenticate to the z/OS Connect EE server with a user identity and password.

\_32. Initially you will be challenged by Firefox because the digital certificate used by the Liberty z/OS server is self-signed (recall that we're using simple basic security for the time being). Click on the **Advanced** button to continue.

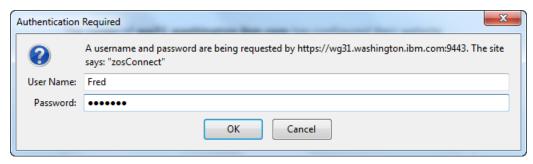

**Tech-Tip:** It is very important to access the z/OS Connect server from a browser prior to any testing using the Swagger UI. Accessing a z/OS Connect URL from a browser starts an SSL handshake between the browser and the server. If this handshake has not performed prior to performing any test the test will fail with no message in the browser and no explanation. Ensuring this handshake has been performed is why you may be directed to access a z/OS Connect URL prior to using the Swagger UI during this exercise.

## \_33. Scroll down and click the **Accept the Risk and Continue** button to continue.

**Tech-Tip:** The configuration of this Firefox browser has been configured to not permanently save certificates under these circumstances. This means that these security risk screens will be displayed every time a browser is restarted until a permanent certificate is installed. This action was enabled by changing the Firefox security.certerrors.permanentOverride preference to false.

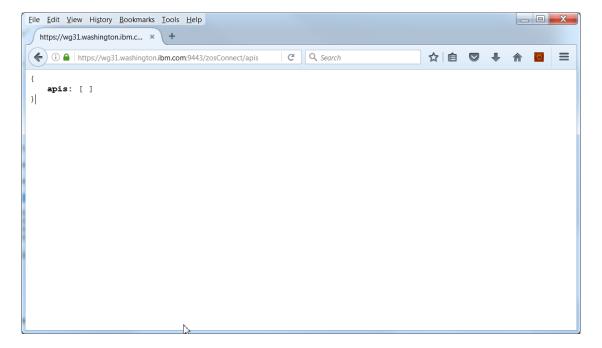

\_\_34. Next you will see a prompt you for a userid and password:

Enter the username *Fred* and password **fredpwd** (case matters) and click **OK**.

Our objective for security at this point in the workshop is simplicity. That's why we're using the security elements coded in the server.xml. Later we will use RACF.

\_\_35. You should now see the following. That is the expected result since no APIs have been installed.

36.	Enter	the	foll	owing	as	the	<b>URI</b>	ز ر

## https://wg31.washington.ibm.com:9443/zosConnect/services

That will query the server for configured services. You should also get a response indicating no services are configured. This is expected.

## **Summary**

You customized the JCL start procedures and started both the Angel process and the server. You have added basic security for z/OS Connect EE V3.0. Finally, you verified basic operations with the browser.

## **Deploying Services and APIs**

In this sections you deploy previously generated service archive and API archives files. The z/OS Connect EE RESTful administrative interfaces will be used to deploy these files. But before the services can be deploy the features required by the services must be installed in the running server.

# Update the z/OS Connect EE Server Configuration

Before we deploy the Services and APIs for the application, the configuration information for the application to the server.xml of the z/OS Connect EE server where the services and APIs will be running.

\_\_1. Edit the *server.xml* in /var/zosconnect/servers/myServer and add the following *include* after the <server description=<new server"> line.

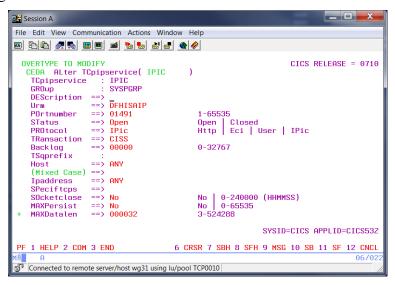

<include location=''/wasetc/zc3lab/ipic.xml'' optional=''true''/>

\_\_\_\_2. Including this file adds a new feature to the server, *cicsService-1.0* which enables add support for connecting to CICS regions using IP interconnectivity (IPIC). In this scenario a CICS IPIC *TCPIPService* (see below) has been defined in the target CICS region to listen for input TCP/IP request on port 1491.

Figure 2: Contents of ipic.xml

**Tech-Tip:** Service names do not have to be explicitly identified in a *zosconnect\_services* element. Services defined in SAR files in the services directory will be automatically installed either a server restart or based on the setting of the *updateTrigger* property (see *server.xml* above). One reason for adding explicit definitions for services (*zosconnect\_services*) is when security attributes are required.

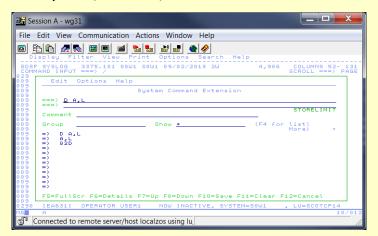

Note, the corresponding CICS TCPIPService definition.

- \_\_\_\_3. Use the **F3** key to end the edit session.
  - \_4. Adding this file using an *include* statement refreshing the z/OS Connect EE V3.0 server. Enter the following MVS command to refresh the configuration **F BAQSTRT,ZCON,REFRESH**

**Tech-Tip:** MVS commands can be only entered on any Spool Search and Display Facility (SDSF) ISPF panel if they are prefixed with a slash. To enter the MVS command DA,L then you must enter DA,L at the Command ===> prompt on the panel. The best way to review the results of the command is to use the SDSF LOG command to access the system log and go to the time in the log the command was entered.

An alternative is to simply enter the SDSF/(slash) command at the command prompt to display the System Command Extension panel (see below).

This panel provides more space for enter command parameter and also provide a means to retrieve and execute previous command. Simply place the cursor on the command in the command history and press enter. This will retrieve the command and place in the active area where a subsequent pressing of the enter key will cause the command to be executed.

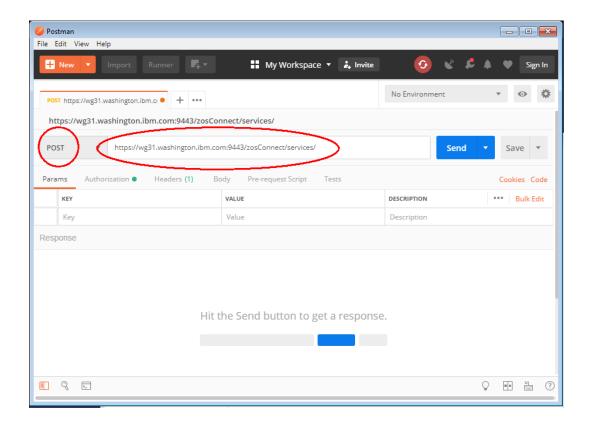

## Deploy the Services

The common application artifacts installed into z/OS connect server are services and APIs (to see how these artifacts are develop review any of the other exercises in this workshop). A service describe an interaction with a back end subsystem and the API describes a RESTful interface to the . Both of these artifacts are archive (e.g. zipped) files. They should be installed using the z/OS Connect EE RESTful administrative interface. Two products which seem to be most popular tools for invoking z/OS Connect EE administrative RESTful APIs are *Postman* which is available for downloading from <a href="https://www.getpostman.com/apps">https://www.getpostman.com/apps</a> and cURL (client URL) which is available for downloading from <a href="https://curl.haxx.se/download.html">https://curl.haxx.se/download.html</a>. The use of both *Postname* an cURL will be shown in this section of the exercise.

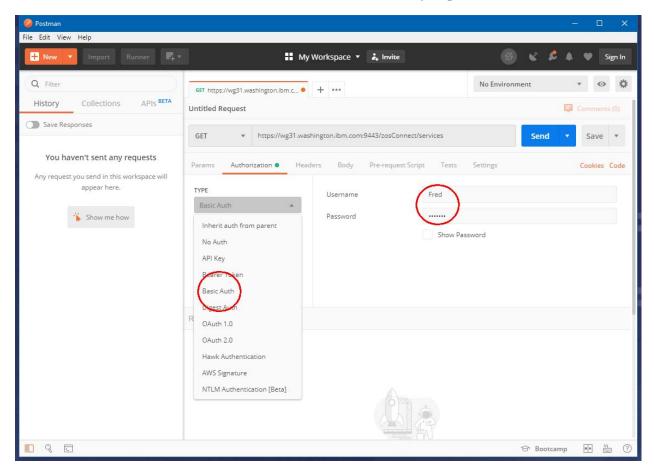

These instructions provide details on both. Choose either *Postman* or *cURL* to deploy the service.

## Using Postman

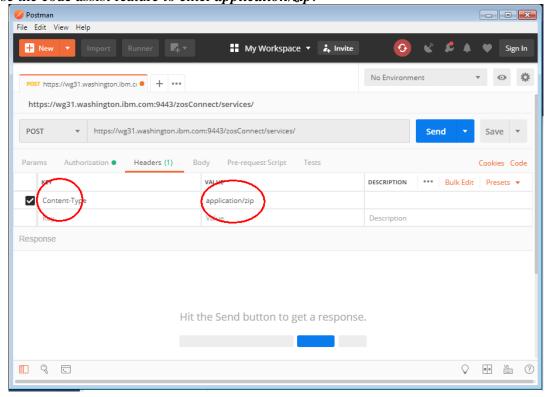

\_1. Open the *Postman* tool icon on the desktop and if necessary reply to any prompts and close any welcome messages, use the down arrow to select **POST** and enter <a href="https://wg31.washington.ibm.com:9443/zosConnect/services/">https://wg31.washington.ibm.com:9443/zosConnect/services/</a> in the URL area (see below).

\_\_\_2. Next select the *Authorization* tab to enter an authorization identity and password. Use the pull down arrow to select *Basic Auth* and enter *Fred* as the username and *fredpwd* as the Password.

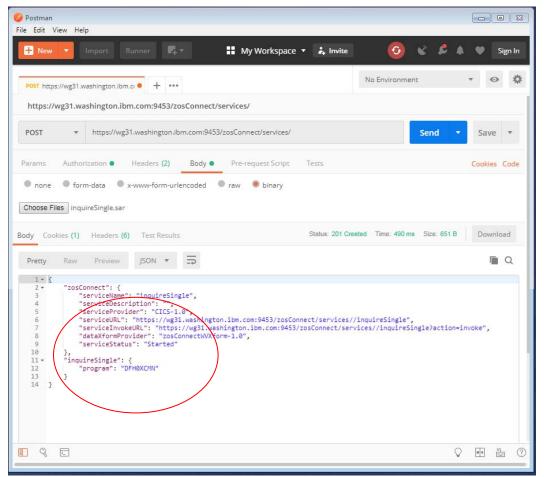

3. Next select the *Headers* tab and under *KEY* use the code assist feature to enter *Content-Type* and under *VALUE* use the code assist feature to enter *application/zip*.

**Tech-Tip:** Code assist simply means that when text is entered in field, all the valid values for that field that match the typed text will be displayed. You can select the desired value for the field from the list displayed and that value will populate that field.

\_\_4. Next select the *Body* tab and select the *binary* radio button and then use the **Choose Files** button to navigate to folder *c:/z/admin* and select the *inquireSingle.Sar* file. Then press the **Send** button. A response message should come back indicating the service has been started and other details about the

service.

## Using cURL

The *cURL* tool provides a command line interface to REST APIs. The same administrative API service invoked with *Postman* can be invoked with *cURL* as shown here.

1. Use the *Command Prompt* icon on the desktop to open a DOS command prompt session.

2. In the session use the change directory (cd) command to go to directory c:\z\admin, e.g. *cd c:\z\admin* 

curl -X POST --user Fred:fredpwd --data-binary @inquireSingle.sar --header "Content-Type: application/zip" --insecure https://wg31.washington.ibm.com:9443/zosConnect/services

Microsoft Windows [Version 6.1.7601]

Copyright (c) 2009 Microsoft Corporation. All rights reserved.

3. Paste the command below at the command prompt and press **Enter**.

C:\Users\workstation>*cd c:\z\admin* 

c:\z\admin>curl -X POST --user Fred:fredpwd --header "Content-Type: application/zip" -d @inquireSingle.json --insecure https://wg31.washington.ibm.com:9443/zosConnect/services {"zosConnect":{"serviceName":"inquireSingle", "serviceDescription":"", "serviceProvider":"CICS-1.0", "serviceURL": "https://wg31.washington.ibm.com:9453/zosConnect/services/inquireSingle",

"serviceInvokeURL": "https://wg31.washington.ibm.com:9443/zosConnect/services/inquireSingle?action =invoke",

"dataXformProvider":"zosConnectWVXform-1.0","serviceStatus":"Started"},
"inquireSingle":{"program":"DFH0XCMN"}}

## **Tech-Tip:** In the above example:

--user Fred:fredpwd could have been specified as --header ''Authorization: Basic RnJlZDpmcmVkcHdk''

*inquireCatalog.sar* is a file in the same directory in which the command is executed

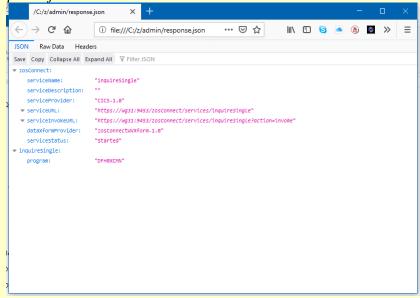

*--insecure* is a *cURL* directive that tells *cURL* to ignore the self-signed certificate sent by the z/OS Connect EE server

The text in green is the JSON response message.

**Tech-Tip:** Another useful cURL directive is *-o response.json* 

When this directive is used the JSON response message is written to a file named *response.json* which then can be opened with Firefox and viewed in a more readable format, e.g. command *firefox* 

file:///c:/z/admin/response.json

\_\_\_\_4. Use either *Postman* or *cURL* to deploy the *inquireCatalog.sar* file.

curl -X POST --user Fred:fredpwd --data-binary @inquireCatalog.sar --header ''Content-Type: application/zip'' --insecure https://wg31.washington.ibm.com:9443/zosConnect/services

\_\_\_\_5. Use either *Postman* or *cURL* to deploy the *placeOrder.sar* file.

curl -X POST --user Fred:fredpwd --data-binary @placeOrder.sar --header ''Content-Type: application/zip'' --insecure https://wg31.washington.ibm.com:9443/zosConnect/services

**Tech-Tip:** The only differences between the commands is the name of the service archive file being deployed.

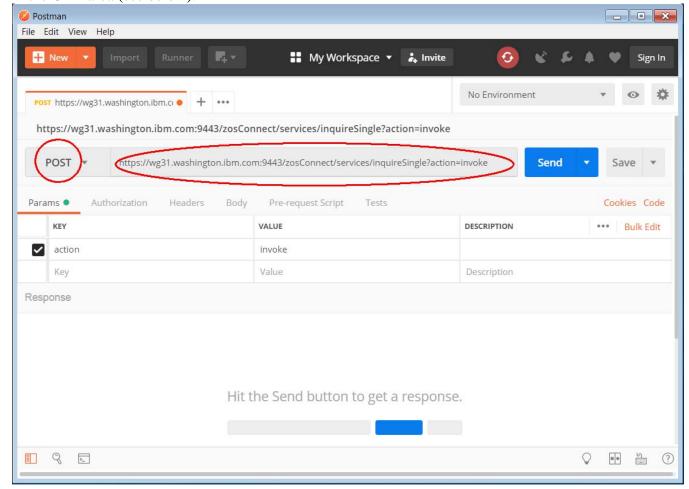

### Test the Services

The services should be tested to ensure the infrastructure and the request and response messages are as expected.

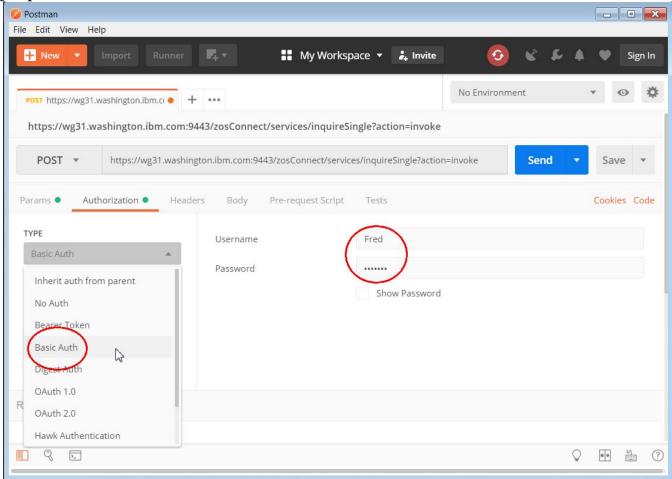

#### Using Postman

\_1. Open the *Postman* tool icon on the desktop and if necessary reply to any prompts and close any welcome messages, use the down arrow to select **POST** and enter

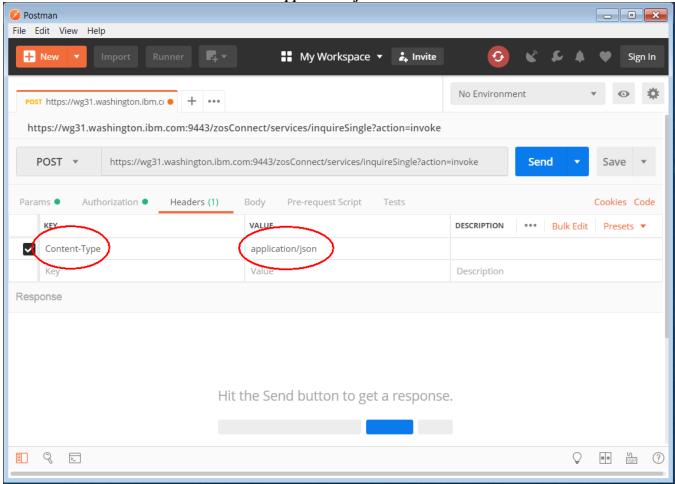

https://wg31.washington.ibm.com:9443/zosConnect/services/inquireSingle?action=invoke in the URL area (see below).

\_2. No *query* or *path* parameters are required so next select the *Authorization* tab to enter an authorization identity and password. Use the pull down arrow to select *Basic Auth* and enter *Fred* as the username and *fredpwd* as the Password.

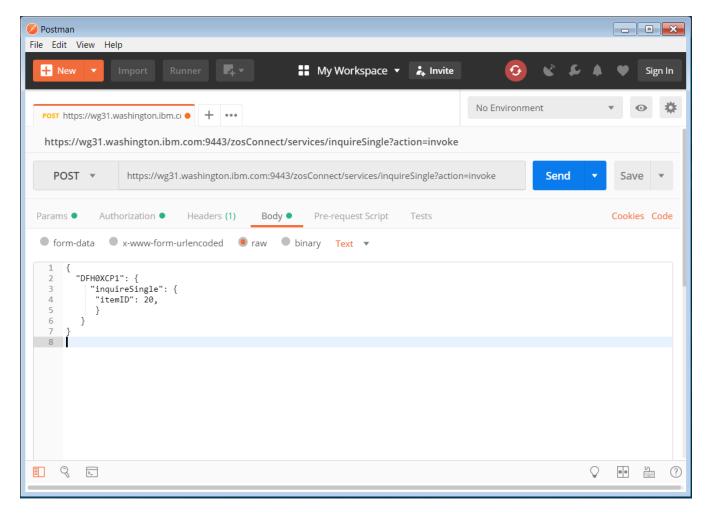

3. Next select the *Headers* tab and under *KEY* use the code assist feature to enter *Content-Type* and under *VALUE* use the code assist feature to enter *application/json*.

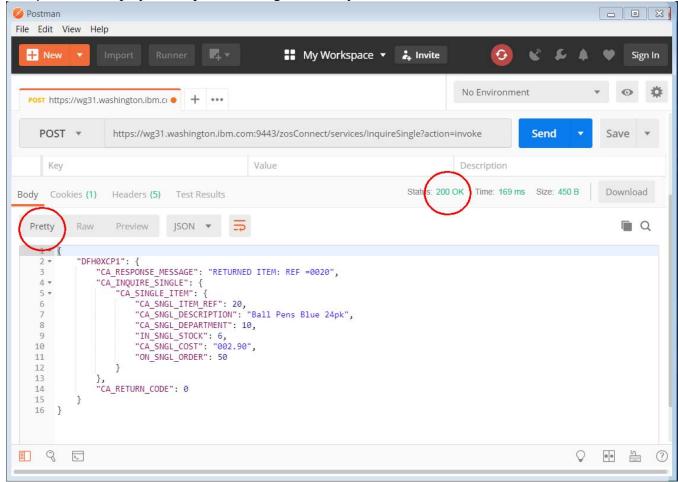

**Tech-Tip:** Code assist simply means that when text is entered in field, all the valid values for that field that match the typed text will be displayed. You can select the desired value for the field from the list displayed and that value will populate that field.

4. Next select the *Body* tab and select the *raw* radio button and enter the JSON message below in the *Body* area and press the **Send** button.

```
{
    "DFH0XCP1": {
        "inquireSingle": {
            "itemID": 20,
            }
        }
}
```

\_\_5. Pressing the **Send** button invokes the API. The Status of request should be 200 OK and pressing the *Pretty* tab will display the response message is an easy to read format, see below.

#### Using cURL

The *cURL* tool provides a command line interface to REST APIs. The same service just tested with *Postman* can be tested with *cURL* as shown here.

- \_\_\_\_1. Use the *Command Prompt* icon on the desktop to open a DOS command prompt session.
- 2. In the session use the change directory (cd) command to go to directory c:\z\admin, e.g.  $cd c:\z\admin$

\_\_\_3. Paste the command below at the command prompt and press **Enter**.

curl -X POST --user Fred:fredpwd --header "Content-Type: application/json" -d @inquireSingle.json --insecure https://wg31.washington.ibm.com:9443/zosConnect/services/inquireSingle?action=invoke

jMicrosoft Windows [Version 6.1.7601] Copyright (c) 2009 Microsoft Corporation. All rights reserved.

C:\Users\workstation>*cd c:\z\admin* 

c:\z\admin>curl -X POST --user Fred:fredpwd --header "Content-Type: application/json" -d @inquireSingle.json --insecure

https://wg31.washington.ibm.com:9443/zosConnect/services/inquireSingle?action=invoke {"DFH0XCP1":{"CA\_RESPONSE\_MESSAGE":"RETURNED ITEM: REF =0020","CA\_INQUIRE\_SINGLE":{"CA\_SINGLE\_ITEM":{"CA\_SNGL\_ITEM\_REF":20,"CA\_SNGL\_DESCRIPTION":"Ball Pens Blue 24pk", "CA\_SNGL\_DEPARTMENT":10, "IN\_SNGL\_STOCK":6, "CA\_SNGL\_COST":"002.90", "ON\_SNGL\_ORDER":50}}, "CA\_RETURN\_CODE":0}}

#### **Tech Tip:** In the above example:

--user Fred: fredpwd could have been specified as --header ''Authorization: Basic RnJlZDpmcmVkcHdk''

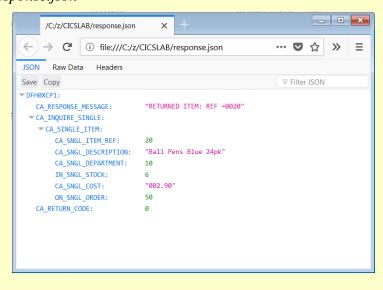

*inquireSingle.json* is a file in the same directory that contains the JSON request message

*--insecure* is a *cURL* directive that tells *cURL* to ignore the self-signed certificate sent by the z/OS Connect EE server

The text in green is the JSON response message.

**Tech-Tip:** Another useful cURL directive is *-o response.json* 

When this directive is used the JSON response message is written to a file named *response.json* which then can be opened with Firefox and viewed in a more readable format, e.g. command *firefox file:///c:/z/admin/response.json* 

\_\_\_4. The *inquireCatalog* service can be tested with *Postman* or *cURL* with URL <a href="https://wg31.washington.ibm.com:9443/zosConnect/services/inquireCatalog?action=invoke">https://wg31.washington.ibm.com:9443/zosConnect/services/inquireCatalog?action=invoke</a> and JSON request message.

```
{
  "DFH0XCP1": {
    "inquireCatalog": {
      "startItemID": 20
      }
  }
}
```

The corresponding cURL command and results are shown below:

curl -X POST --user Fred:fredpwd --header "Content-Type: application/json"

-d @inquireCatalog.json --insecure

https://wg31.washington.ibm.com:9443/zosConnect/services/inquireCatalog?action=invoke

c:\z\admin>curl -X POST --user Fred:fredpwd --header ''Content-Type: application/json'' -d @inquireCatalog.json --insecure https://wg31.washington.ibm.com:9443/zosConnect/services/inquireCatalog?action=invoke

{"DFH0XCP1":{"CA\_RESPONSE\_MESSAGE":"+15 ITEMS RETURNED","CA\_INQUIRE\_REQUEST":{"C A\_LAST\_ITEM\_REF":150,"CA\_CAT\_ITEM":[{"ON\_ORDER":0,"CA\_ITEM\_REF":10,"CA\_COST":"00 2.90","IN\_STOCK":135,"CA\_DESCRIPTION":"Ball Pens Black 24pk","CA\_DEPARTMENT":10}, {"ON\_ORDER":50,"CA\_ITEM\_REF":20,"CA\_COST":"002.90","IN\_STOCK":6,"CA\_DESCRIPTION ":"Ball Pens Blue 24pk","CA\_DEPARTMENT":10}, {"ON\_ORDER":0,"CA\_ITEM\_REF":30,"CA\_C OST":"002.90","IN\_STOCK":106,"CA\_DESCRIPTION":"Ball Pens Red 24pk","CA\_DEPARTMEN T":10}, {"ON\_ORDER":0,"CA\_ITEM\_REF":40,"CA\_COST":"002.90","IN\_STOCK":80,"CA\_DESCR IPTION":"Ball Pens Green 24pk","CA\_DEPARTMENT":10}, {"ON\_ORDER":0,"CA\_ITEM\_REF":5 0,"CA\_COST":"001.78","IN\_STOCK":83,"CA\_DESCRIPTION":"Pencil with eraser 12pk","C A\_DEPARTMENT":10}, {"ON\_ORDER":0,"CA\_COST":"003.89","IN\_STOCK": 13,"CA\_DESCRIPTION":"Pencil with eraser 12pk","C A\_DEPARTMENT":10}, {"ON\_ORDER": 20,"CA\_ITEM\_REF": 60,"CA\_COST":"003.89","IN\_STOCK": 20,"CA\_ITEM\_REF": 70,"CA\_COST":"007.44","IN\_STOCK": 101,"CA\_DESCRIPTION":"Laser Pa per 28-lb 108 Bright 500\/ream","CA\_DEPARTMENT":10}, {"ON\_ORDER":0,"CA\_ITEM\_REF": 80,"CA\_COST":"033.54","IN\_STOCK":25,"CA\_DESCRIPTION":"Laser Paper 28-lb 108 Bright 500\/ream","CA\_DEPARTMENT":10}, {"ON\_ORDER":0,"CA\_ITEM\_REF": 80,"CA\_COST":"033.54","IN\_STOCK":25,"CA\_DESCRIPTION":"Laser Paper 28-lb 108 Bright 500\/ream","CA\_DEPARTMENT":10}, {"ON\_ORDER":0,"CA\_ITEM\_REF":

The *placeOrder* service can be tested using *Postman* or *cURL* with URL: https://wg31.washington.ibm.com:9443/zosConnect/services/placeOrder?action=invoke

and JSON request message.

```
{
   "DFH0XCP1": {
      "orderRequest": {
      "itemID": 70,
      "orderQuantity": 1
      }
   }
}
```

The corresponding cURL command and results are shown below:

curl -X POST --user Fred:fredpwd --header "Content-Type: application/json" -d @placeOrder.json --insecure https://wg31.washington.ibm.com:9443/zosConnect/services/placeOrder?action=invoke

```
c:\z\admin>curl -X POST --user Fred:fredpwd --header "Content-Type: application/json"
-d @placeOrder.json --insecure https://wg31.washington.ibm.com:9443/zosC
onnect/services/placeOrder?action=invoke
{"DFHOXCP1":{"CA_RESPONSE_MESSAGE":"ORDER SUCCESSFULLY PLACED", "CA_RETURN_CODE":
0}}
```

## Deploy and Test the API

The API artifact should be deployed using z/OS Connect RESTful administrative interface. cURL will be used in this section but Postman could have been used also.

\_\_\_\_1. Deploy the API archive file using cURL. Paste the command below at the command prompt and press **Enter**.

curl -X POST --user Fred:fredpwd --data-binary @catalog.aar --header "Content-Type: application/zip" --insecure https://wg31.washington.ibm.com:9443/zosConnect/apis

```
C:\z\admin>curl -X POST --user Fred:fredpwd --data-binary @catalog.aar --header "Content-Type: application/zip" --insecure https://wg31.washington.ibm.com:9453/zosConnect/apis {"name":"catalog", "version":"1.0.0", "description":"", "status":"Started", "apiUrl":"https://wg31.washington.ibm.com:9453/catalog", "documentation": {"swagger": "https://wg31.washington.ibm.com:9453/catalog/api-docs"}, "services": [ {"name": "placeOrder", "uri": "https://wg31.washington.ibm.com:9453/zosConnect/services/place Order"}, {"name": "inquireSingle", "uri": "https://wg31.washington.ibm.com:9453/zosConnect/services/inquireSingle"}, {"name": "inquireCatalog", "uri": "https://wg31.washington.ibm.com:9453/zosConnect/services/inquireCatalog"} ]}
```

\_\_\_\_2. Next enter URL <a href="https://wg31.washington.ibm.com:9443/zosConnect/apis">https://wg31.washington.ibm.com:9443/zosConnect/apis</a> in the Firefox browser and you should see the window below. The <a href="mailto:catalog">catalog</a> API now shows as being available.

\_\_3. If you click on *adminUrl* URL the window below should be displayed:

```
<u>File Edit View History Bookmarks Tools Help</u>
                                                                                                     - - X
     https://wg31.washington.ibm.com:9443/zosConnect/apis/catalog
                                                                 C Q Search
                                                                                                    name: "catalog",

### **Summary**

You have verified the API. The API layer operates above the service layer you defined. The API layer provides a further level of abstraction and allows a more flexible use of HTTP verbs, and better mapping of data via the API editor function.
